FIELDVANTAGE_PRESENTATION

FieldVantage

The platform that puts your operation under control

> Presentation document — March 2026
>
> For customers, partners, and investors

The problem we solve

Any organization with operational teams — from a cleaning company to a factory, from a restaurant to a chain of stores — grows with a lot of operation and little organization. Day-to-day activities are managed via WhatsApp, spreadsheets, and memory. The result:

- Lost or duplicate orders
- Teams that don't know what to do or where to go
- Managers who need to call to find out the status of each service
- Customers dissatisfied with lack of communication
- Impossibility of growing with more than one unit without losing control

FieldVantage solves all of this in one place.

What is FieldVantage

FieldVantage is a team operations management platform—for any organization that needs to control who does what, when, and where. Whether you're an outside services company, a restaurant, a factory, a hotel, or a corporate office, FieldVantage centralizes work orders, teams, and branches in one place. From scheduling to completion, every task is tracked in real time—with full visibility for the manager and absolute clarity for the team.

> It works in your browser, on any device. No installation required.

Who it's for

Industry	How to use
Commercial and residential cleaning	Schedule recurring services, distribute teams by shift, record before/after photos
Building maintenance	Open tickets by unit, track the status of each intervention
Construction and renovations	Organizes teams by project, records progress with photos and notes
Landscaping and gardening	Manage weekly routes, mobile teams serving multiple clients
Property services	Controls periodic inspections and history by client
Restaurants and food service	Controls periodic cleaning, equipment maintenance, and sanitary inspections
Factories and industry	Preventive and corrective maintenance orders for machines, safety inspections
Hotels and lodging	Room cleaning management, facility maintenance, housekeeping control
Offices and facilities	Internal maintenance, scheduled cleaning, physical call control
Retail chains and franchises	Periodic inspections and audits in each store, standardization between units
Condominiums	Maintenance services, janitorial services, control of third-party providers
Transportation and logistics	Fleet inspection, vehicle maintenance orders per unit
City halls and public services	Urban janitorial teams, park maintenance, and public lighting
Events and production	Management of assembly and disassembly teams by location and event

> FieldVantage is not exclusive to field services. Any operation with teams, tasks, and units benefits from the platform.

How it works — Overview

```
Gestor cria a empresa  →  Cadastra filiais e colaboradores
      ↓
Colaboradores recebem link de convite e criam seu acesso
      ↓
Gestor cria ordens de serviço e atribui à equipe
      ↓
Equipe executa, atualiza o status e registra fotos
      ↓
Gestor acompanha tudo em tempo real no painel
```

Key features

1. Real-time operational dashboard

The main screen of the system. It updates automatically and shows the exact status of the operation at any given moment.

What the manager sees:

- **4 indicators for the day** — scheduled orders, orders in progress, delayed orders, and orders without an assigned person. Clickable, they take you directly to the filtered list.
- **Progress bar** — percentage view of how much of the day has already been completed.
- **Automatic alerts** — panels that appear only when there are problems: delayed orders, services that should have started, and orders with no one assigned.
- **Interactive monthly calendar** — colored dots indicate days with active orders (blue) or delayed orders (red). Clicking on any day opens that day's schedule.
- **Live list** — orders in progress at that exact moment, with customer, time, and who is executing them.
- **Today's schedule** — all services for the day, in the right order.

Customized visibility by profile:
- The owner and general manager see everything.
- The branch manager sees only the data for their unit.
- Employees see only their own orders.

---

2. Service orders — from scheduling to completion

The heart of the platform. Each service starts as an order and goes through its entire life cycle with full traceability.

Order creation:
- Title, customer, customer address
- Start date and time and estimated completion time
- Responsible branch (for companies with multiple units)
- Assigned team (one or more employees)
- Internal notes

Recurring orders:
Services that are repeated — weekly, biweekly, monthly, annually — can be configured once. The platform manages recurrence automatically.

Lifecycle:

```
Agendada  →  Em andamento  →  Concluída
                           →  Cancelada
```

Each status change is recorded with the date, time, and who made the change. Nothing is lost.

Views:
- **List** — table with filters by status, period, branch, and text search
- **Kanban** — visual board with columns by status; drag cards to update progress

Change status: available both in the order list and directly on the detail screen—the employee does not need to leave the order to record an update.

Photos and Attachments:
Each order has a dedicated gallery for visual documentation of the service.
- Sending photos (JPEG, PNG, WebP) and documents (PDF)
- Up to 20 files per order, up to 10 MB each

- Full-screen view with navigation between images
- Date of upload displayed on each photo
- Descriptive note per photo (editable at any time)
- Deletion with confirmation — nothing is removed by accident

> Ideal for: before/after records, proof of service performed, visual reports and assessments.

---

3. Customer management

Complete registration of all customers who will receive services.

- Name, company, email, phone number, and photo
- **Multiple addresses per customer** — each with a custom label, specific note, and main marking
- Direct link to open the address in Google Maps, Waze, or Apple Maps
- Complete history of all orders for that customer
- Creation of a new order directly from the customer's file

---

4. Employee and access management

Complete system to control who is part of the team, what each person can see and do, and how each person logs into the platform.

Registration:
- Name, email (required — this is the system login), position, phone number, photo
- Access profile (see "Permissions" section)
- Branches where they work (can be more than one)

Invitation system:
Employees do not create accounts on their own. The flow is simple and secure:
1. The manager registers the employee and defines their profile and branches
2. The system automatically generates an **invitation link** with a 7-day deadline
3. The manager copies the link or sends it by email
4. The employee accesses the link, creates their password, and logs directly into the account
5. Access configured — no red tape

Invitation management:
In each employee's file, the manager can at any time:
- Generate a new link (the previous one is automatically invalidated)
- Revoke access
- View the current status: Pending, Accepted, Expired, or Revoked

List view:
Distinctive visual badge for employees with invitations not yet accepted (yellow "Pending") — not to be confused with active employees.

---

5. Branches — multi-unit management

For companies with more than one operating unit.

- Unlimited creation of branches with name, address, and contact details
- Each order can be associated with a branch
- Each employee can be linked to one or more branches simultaneously
- **Segregated visibility:** the manager of branch A cannot see the data for branch B — and vice versa
- The owner and general manager maintain a complete view of all units

---

6. Internal messaging

Direct communication between team members within the platform itself.

- Real-time chat between any two members of the company
- Messages arrive instantly (no need to refresh)
- Unread message counter on the message icon
- Complete history of all conversations
- Privacy guaranteed: messages visible only to sender and recipient

---

7. Settings and customization

Company profile:
- Name, logo, industry, address, and contact details

- The logo appears in the system header as soon as it is saved

User preferences:
- Theme: light, dark, or automatic (follows the operating system)
- Language: Brazilian Portuguese, English, or Spanish
- Preferred navigation app: Google Maps, Waze, or Apple Maps

Access model and permissions

FieldVantage adopts a model of **three profiles** combined with **branch scope** —the standard used by the leading field management SaaS providers on the market (Jobber, Housecall Pro, ServiceTitan).

The 3 profiles

Profile	Who is	What they can do
Owner	Business owner	Full access; the only one who can promote someone to General Manager
Administrator	General Manager or Branch Manager	Manages orders, employees, and customers within their scope
Collaborator	Technician, service provider, employee	Performs services, updates status, and sees only their orders

Branch scope

The same "Administrator" profile can have different scopes:

Configuration	What they see
Administrator — Entire company	All orders and data from all branches
Administrator — Central Branch	Only data from the Central Branch
Administrator — 2 branches	Data from branches A and B, but not from C
Administrator — No branch	Only orders assigned directly to him

This eliminates the need to create separate positions such as "General Manager" or "Branch Supervisor" — the system automatically displays the correct label for each person.

Access security rules

Rule	Detail
No user can change their own profile	Prevents privilege escalation
Only the Owner can create a General Administrator	Absolute control of the top hierarchy
Branch Administrators can only invite Collaborators	Cannot create other managers
Invitations have an expiration date	Links expire in 7 days and are invalidated after use
Orders without a defined branch	Visible only to the Owner

Data security and privacy

FieldVantage was built with security as a fundamental layer—not as an add-on.

Total isolation by company:
Each company has its data completely separated. No employee of one company can, under any circumstances, access data from another.

Database control:
In addition to system verification, all visibility rules are applied directly to the database (Row Level Security). Even a direct query to the database will not return data that the user is not authorized to see.

Secure authentication:
- Login by email and password with JWT token
- Session managed via secure cookies (HttpOnly)
- Invitation tokens stored as hash — never in plain text

Double layer of protection:
Each critical operation is verified both on the interface and on the server. An unauthorized action cannot be executed even if someone tries to manipulate the interface.

Technology and scale

FieldVantage was built on the infrastructure of the most reliable platforms on the market:

Layer	Technology	Why
Interface	Next.js 15 (React)	Performance, SEO, and loading speed
Database	PostgreSQL (Supabase)	Reliability, scale, and advanced security
Authentication	Supabase Auth	Secure session and user management
File storage	Supabase Storage	Secure upload and access to photos and documents
Real-time messaging	Supabase Realtime	Chat and instant updates via WebSocket
Hosting	Vercel + Cloudflare	High availability and global CDN
Language	TypeScript (100%)	Reliable code, lower chance of bugs in production

Multi-language: the platform is available in Brazilian Portuguese, English, and Spanish — ready for international operations.

Mobile-first: designed first for mobile. Works perfectly on any device, without the need to install anything.

Multi-tenant: each company is an independent environment. The platform supports an unlimited number of companies without performance degradation.

Why FieldVantage

Versus the competition	FieldVantage
Complex systems with a long learning curve	Simple interface, onboarding in minutes
High price with features that will never be used	Focus on the essentials for team operations
No support for multiple branches in basic plans	Multi-branch available from the start
Native app required	Works directly in the browser, on any device
Data mixed between companies	Total isolation by company, by design

What's next — Roadmap

The following features are planned for future versions:

- **Reports and exports** — PDF of orders, productivity report per employee, history per branch
- **Native mobile app** — iOS and Android with offline support
- **Digital signature** — confirmation of service performed by the customer directly on their cell phone
- **WhatsApp integration** — automatic notification to the customer about order status
- **Customer portal** — external access for customers to track the progress of their services
- **Billing and quotes** — generation of proposals and charges integrated with the order
- **Live team tracking** — real-time map showing the location of each employee, status indication (in transit/in progress), and route history for the day
